# Why SUSY?

# Why SUSY?

The SM fits the experimental data very well. However, few problems remain, e.g.:

- dark matter
- the hierarchy problem
- unification of forces at the GUT scale

SUSY was created to remedy these problems.

Dark matter  
Hierarchy problem  
Unification of forces at the GUT scale

## Dark matter

Astrophysicists observe that the gravitational lensing effect and rotational speed of a galaxy suggest far more mass than expected by the visible mass of the galaxy. This suggests new, unobserved particles.

**Figure:** left - from: [http://wmap.gsfc.nasa.gov/universe/uni\\_matter.html](http://wmap.gsfc.nasa.gov/universe/uni_matter.html), right - from: <http://www.astronomy.ohio-state.edu/thompson/1144/Lecture40.html>

## R-parity

SUSY symmetry breaking  
Minimal SUSY Standard Model (MSSM)  
Minimal Supergravity (mSUGRA)  
Free parameters of the MSSM

# R-parity

Due to new interactions, lepton and baryon numbers can be violated. To remedy this problem, in many, not all SUSY models a new symmetry is introduced, called R-parity:

$$R = (-1)^{3(B-L)+2S} = \begin{cases} +1 & \text{SM particle} \\ -1 & \text{SUSY particle} \end{cases}$$

Due to R-parity SUSY particles can only be produced in pairs and the lightest SUSY particle cannot decay any further.

1. Why SUSY?
2. What is SUSY?
3. SUSY event topology
4. Searches for SUSY with the LHC
5. Backup

R-parity

SUSY symmetry breaking

Minimal SUSY Standard Model (MSSM)

Minimal Supergravity (mSUGRA)

Free parameters of the MSSM

## Free parameters of the MSSM

the full MSSM contains 105 free parameters  $\Rightarrow$  too many, we need to simplify

*pMSSM*: fixing mass hierarchies of the SUSY particles to gain sensitivity to certain decay chains and topologies (22 free parameters)

*cMSSM*: Assumption of unification of masses at the GUT scale leads to 5 remaining parameters.

## free parameters of the MSSM (cont.)

### pMSSM

- sfermion masses
- gaugino masses
- proportionality factors of the trilinear couplings  $A_f$
- squared Higgs boson masses
- $\tan \beta$

### cMSSM

- unification of scalar masses  $m_0$
- unification of gaugino masses  $m_{1/2}$
- unification of the trilinear couplings  $A_0$
- the sign of the higgsino mass factor  $\mu$
- $\tan \beta$

with  $\tan \beta = \tan \frac{v_1}{v_2}$ ,  $v_1, v_2$  vacuum expectation values of the Higgs field.

## variable definitions

following variables not familiar to everyone are used in this analysis:

$$\alpha_T = \frac{E_T^{j_2}}{M_T}$$

$$M_T = \sqrt{(E_T^{j_1} + E_T^{j_2})^2 - (p_x^{j_1} + p_x^{j_2})^2 - (p_y^{j_1} + p_y^{j_2})^2}$$

$$H_T = \sum_{i=1}^{n_{\text{jet}}} E_T^{j_i}$$

$$\cancel{H}_T = \left| \sum_{i=1}^{n_{\text{jet}}} p_T^{j_i} \right|$$

Search using the variable  $\alpha_T$  and b-quark multiplicity by CMS

## generalization of $\alpha_T$

$\alpha_T$  can be generalized to more than 2 jets. All jets are summed up in such a way, that their  $H_T$  are as close together as possible (difference:  $\Delta H_T$ ):

$$\alpha_T = \frac{H_t - \Delta H_T}{2\sqrt{H_t^2 - H_T^2}}$$

## definition of signal regions

Analysis bin $H_T$ [GeV]	Trigger thresholds		Trigger efficiency [%]	
	$H_T$ [GeV]	$\alpha_T$	$2 \leq n_{\text{jet}} \leq 3$	$n_{\text{jet}} \geq 4$
275–325	250	0.55	$89.1^{+0.4}_{-0.4}$	$83.7^{+0.6}_{-0.6}$
325–375	300	0.53	$98.7^{+0.2}_{-0.3}$	$98.2^{+0.4}_{-0.5}$
375–475	350	0.52	$99.0^{+0.4}_{-0.5}$	$99.7^{+0.2}_{-0.6}$
$\geq 475$	400	0.51	$100.0^{+0.0}_{-0.6}$	$100.0^{+0.0}_{-0.8}$

Figure: definition of signal regions in [6]

## major backgrounds

Major backgrounds are:

- $Z$ +jets and  $W$ +jets for  $n_b = 0$
- $t\bar{t}$  and single-top for  $n_b \geq 1$
- QCD multijet is suppressed by cuts

## exclusion limits

to interpret the result, each model was given a channel:

Model	$n_{\text{jet}}$	$n_b$
D1	2-3	0
D2	2-3	1, 2
D3	$\geq 4$	1, 2
G1	$\geq 4$	0
G2	$\geq 4$	2, 3, $\geq 4$
G3	$\geq 4$	2, 3, $\geq 4$
